

As the nerve thickens, it occupies more space and is more easily rubbed. Eventually, the nerve gets so big that it is sensitive to every step and it can even spread the toes. This gap is sometimes referred to as "the daylight sign" because you can see light between your toes.

Only Foot Solutions Exclusive Custom Biomechanical Arch Supports™ give your feet that custom, fit-like-a-glove support!

Let us help you learn more about your body so that you can do what it takes to stay healthy and pain free.

The Truth
About

Morton's Neuroma

This brochure is provided to offer a general overview on this topic and may not apply to everyone. To find out if this handout applies to you and to get more information on this subject, talk to your doctor or podiatrist and a Foot Solutions foot specialist.

What Is It?

A Morton's Neuroma is a common foot problem consisting of a benign tumor-like enlargement of a nerve at the ball of the foot. It is usually located between the third and fourth toes, or occasionally between the second and third. This condition is not a true tumor but rather a thickening of the tissue around the nerve.

Symptoms of a Morton's Neuroma include sharp pain, burning sensation and even a lack of feeling in the area. It is usually worsened by walking and applying pressure on the ball of the foot. This is a soft tissue deformity and will not show up on an x-ray. Diagnosis is made by eliciting pain in the area between the toes with pressure on the nerve. You may notice an increased gap or space between your third and fourth toes, and moving your toes in certain directions may cause a clicking sensation as the enlarged nerve slides under a nearby ligament.

How did I get it?

A neuroma is formed by irritation and rubbing of the nerve, similar to the way a callus is formed on your skin from excessive rubbing or pressure. The nerve "skin" gradually thickens to protect itself, forming a benign tumor. When the arch of your foot collapses, it causes excess force to shift away from the big toe and onto the smaller bones of your forefoot. These smaller bones are not designed to handle the loads, so the excess force tends to break down the tissues under them, including the nerves running between them to the toes. As the nerve thickens to protect itself, it occupies more space and is more easily rubbed. Eventually, the nerve gets so big that it is sensitive to every step and it can even spread the toes. This gap is sometimes referred to as "the daylight sign" because you can see light between your toes, as pictured on the cover.

Shoes that are too tight in the toe area or high heels that place additional pressure on your forefoot, and an increase in activity are also thought to exacerbate the pain of a Morton's Neuroma.

How is it addressed?

As with most foot problems there are two main concepts in the treatment of a Morton's Neuroma: 1) reduce the symptoms, and 2) address the underlying cause.

Injections: Cortisone can be injected into the area to control inflammation and pain. This may be helpful in reducing the pain temporarily but does not address the cause of your symptoms. Overuse of injected steroids can result in side effects such as weight gain and increased blood pressure and can interfere with proper healing, which is why patients only receive a limited number of injections. Talk to your doctor about the indications and risks for this treatment.

Surgery: In cases that do not respond to conservative measures, your doctor may recommend surgery. The surgery is thought to be very successful in reducing the pain of a Morton's Neuroma but is a last resort as it comes with risks. The surgery involves the removal of both the tumor and some of the nerve, often causing permanent numbness in the affected toes. The nerve will slowly grow back over time. If the underlying cause of the original problem is not treated, the nerve will become a "stump neuroma" which is often more painful than the original problem.

Custom Arch Supports: Properly designed custom arch supports will address your pain by correcting the cause of your foot dysfunction. **Foot Solutions Custom Biomechanical Arch Supports™** are uniquely designed to support and restore full arch function in your feet. This also restores proper weight distribution over the big toe and removes the abnormal pressures causing your nerve to thicken. The nerve can then heal and shrink back to normal size. It is important to note that, as with most conditions, attacking the problem early enough is critical to avoid the need for surgery. Should surgery eventually be necessary, the use of **Foot Solutions Custom Biomechanical Arch Supports™** immediately following surgery can help ensure that the tumor does not come back.

What can I expect from treatment?

With a proper diagnosis, and a well-rounded treatment plan based on effective arch supports, the prognosis is excellent. Over 90% of cases will respond favorably to proper arch support management if addressed early enough.
